

## INTRODUCTION TO UTILITY SCREENING TABLES

The following worksheets are used to evaluate the potential impacts of a project.

### Table 1 Definition of Project

This Table is used to establish the proposed development parameters that are used in the calculation of utilities usage. The independent variable to be entered is identified by shading. For residential development, the number of housing units should be entered in the shaded area. For non-residential development, the total floor area of development should be entered in the shaded area.

### Tables 2 Summary of Project Impacts

**Consumption/Generation Rates.** This table indicates the development's projected electrical consumption, natural gas consumption, water consumption, effluent generation, and solid waste generation. No modifications should be made to this table.

### Tables 3 through 5 Calculation of Project Impacts

Tables 3 through 7 indicate the results of the analysis.

**Table 3 Water Consumption** - This Table calculates the projected water consumption rates for new development. Default generation rates provided in the shaded areas may be changed.

**Table 4 Sewage Generation** - This Table calculates the projected effluent generation rates for new development. Default generation rates provided in the shaded areas may be changed.

**Table 5 Solid Waste Generation** - This Table calculates the projected waste generation for new development. Default generation rates provided in the shaded areas may be changed.

### Table 1 Project Name: GGRO 019

**Definition of Project Parameters** - Enter independent variable (no. of units or floor area) in the shaded area. The independent variable to be entered is the number of units (for residential development) or the gross floor area (for non-residential development).
